Correction for page 503:
The sentence „Given the calculation of a 90-percent prediction interval, the predicted value of a given case lies within this interval in 90 samples out of 100 samples“ should read “Given the calculation of a 90-percent prediction interval, a case with specific scores on the covariates lies within this interval in 90 samples out of 100 samples.“ The prediction interval is about the location of cases (i.e., how often we expect the case to be located inside of the interval), not predicted values for the outcome. The following discussion of the prediction interval for the identification of typical and deviant cases follows the correct understanding of the interval.
